

FIRST REVIEW

Tip2Trip AI Travel Planner

Project Development Progress Report: Week 1 & 2

Prepared for: Internship Evaluation / Faculty Review

Week 01: Project Goals & Objectives

Project Vision: Understood the core platform objective to provide seamless AI itineraries, travel buddies finder, and expense splitting.

(File: App.jsx)

Workflow Analysis: Analyzed the end-to-end traveler workflow: Hero Search -> Feature Grid -> Buddy Match -> Timeline Dashboard.

(File: src/components/)

Routing Architecture: Mapped the component navigation structure, tracking page visibility across conditional routes.

(File: Navbar.jsx & App.jsx)

Week 01: Technical Structure & Code Architecture

Frontend Layout: Modular React component setup located in `src/components/` doing dynamic UI rendering.

(File: `src/components/`)

Backend Service: Node/Express backend running `index.js` providing REST endpoints for user authentication and trip timelines.

(File: `server/index.js`)

Data Store: Local JSON-based mockup database used for data persistence of trips, users, and community posts.

(File: `server/db.json`)

Week 01: Environment Setup & Execution

Frontend Dev Server: Configured and ran Vite dev server on `http://localhost:5173` with hot reloading.

(File: `package.json`)

Backend API Server: Configured Express server running on `http://localhost:5000` in nodemon environment.

(File: `server/package.json`)

Proxy Routing: Established proxy targets in `vite.config.js` to forward frontend requests to the API.

(File: `vite.config.js`)

Week 02: Routing & Component Flow

State-based Routing: Used react state variables to transition between views (home, profile, signup, login) smoothly.

(File: App.jsx)

Route Protection: Implemented auth-guards that automatically intercept unauthenticated requests and redirect users to login.

(File: App.jsx)

Dynamic Rendering: Managed transitions and visual feedback overlays during screen updates.

(File: App.jsx)

Week 02: Navbar Customization & Auth States

Conditional Menu Items: Modified menus to display customized items (Avatar, Profile, Sign Out) only when user is logged in.

(File: src/components/Navbar.jsx)

Navigation Callback: Bound the onNavigate event listener to trigger currentPage updates in the parent component.

(File: src/components/Navbar.jsx)

Branding Icons: Updated brand assets, including the compass logo icon and custom text alignments.

(File: src/components/Navbar.jsx)

Week 02: Styling, Layouts & Premium UI

Styling System: Used Tailwind CSS utility classes alongside custom CSS modules for high-fidelity animations.

(File: App.css & tailwind.config.js)

Glassmorphism Effects: Created premium design card layouts using custom backdrop blur filters and border glowing utilities.

(File: src/components/)

Responsive Page Layouts: Refactored grids and spacing to align perfectly on mobile, tablet, and desktop screens.

(File: src/components/)
